

SELF-ACTING PRESSURE REGULATORS **BEE line**

Application

These valves are designed for applications in common warm-water and hot-water heating circuits, refrigeration and air-conditioning with max. pressure differential of 1.6 MPa.

Process media

Valves series BEE line are suitable for process media such as water, air or steam to 1,0 MPa. In addition, they are suitable for cooling mixtures and other non-aggressive media and gases with temperature range +2 °C to +150 °C, possibly with condensate wells up to 180°C. They are not designed for working conditions with cavitation occurence. Sealing surfaces of the trim are resistant to common sludge or water impurities. Yet it is recommended to pipe a strainer in front of the valve to ensure a reliable function and tightness in case there are abrasive particles present in the process medium.

Installation

Basic operating position of regulator is when the body is above its controlling head that points downwards. This position must be kept especially when reducing steam pressure or when temperature exceeds 90 °C. For gases and liquids with temperatures under 90° C, the valve can be installed into vertical pipeline or into horizontal pipeline with controlling head pointing sideways.

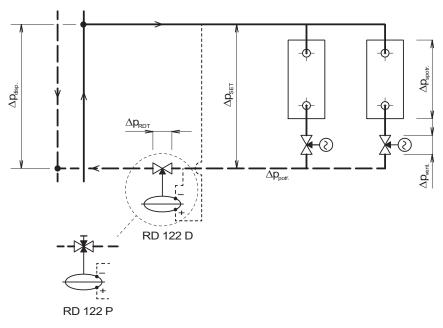

Impulse pipelines for extraction of the pressure from the body or the pipeline are within the scope of supply as standard.

Typical scheme of wiring for regulators RD 122 D, P, V

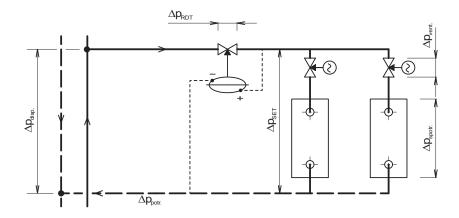

(rising pressure / pressure difference closes the valve)

Scheme of typical regulation loop with differential pressure regulator RD 122 D (P) at secondary side

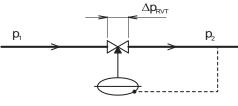

In cases that the differential pressure regulator is forced to work with high differential pressure ($\Delta p_{RDT} > 250$ kPa), the producer recommends to install both differential pressure regulator and control valves at primary line of the control loop. Such an installation ensures better working conditions for the regulator and better function of the whole system.

RD 122 D RD 122 P RD 122 V

BEE line

DN 15 - 50 PN 25

Self-acting regulator of differential pressure series RD 122 D is designed to keep a constant differential pressure value of given appliance. Such a function is ensured by a diaphragm exposed to effects of input and output pressure of the appliance. Deflection of the diaphragm is transfered to the valve plug and it closes the valve upon increase of differential pressure value.

Self-acting regulator of differential pressure with flow restrictor RD 122 P ensures requirement for restriction of maximum flow through the appliance apart from its basic function (keeping constant differential pressure value). This function is provided by a secondary plug adjusted for the required maximum flow by the operator.

Self-action regulator of output pressure type RD 122 V is designed to reduce output pressure of the appliance and to maintain it on set value. This function is enabled by diaphgragm exposed to the effects of the output pressure and actuated by spring from the second side. Deflection of the diaphragm is transferred to the valve plug and **it closes the valve upon increase of output pressure valve**.

In case when required value of regulated pressure quantity is within scope of two spring ranges, it is recommended to choose the spring with lower values to ensure sensitivity of the regulator. Owing to a pressure-balanced plug, value of differential pressure is not affected by pressure conditions within the valve.

RD 123 R RD 123 S

BEE line

DN 15 - 50 PN 25

Self-acting bypass valve RD 123 R is designed to by-pass appliance when set pressure difference is exceeded. Such a function is ensured by a diaphragm exposed to the effects of input and output pressure of the appliance. Deflection of the diaphragm is transferred to the valve plug and it opens the valve upon increase of differential pressure value.

Self-acting regulator of input pressure RD 123 S is designed to limit maximum pressure in the system. Diaphragm is exposed to the pressure from the pipeline and **the increase of this pressure over set value causes opening of the valve.**

In case when required value of regulated pressure quantity is within scope of two spring ranges, it is recommended to choose the spring with lower values to ensure sensitivity of the regulator. Owing to a pressure-balanced plug, value of controlled pressure is not affected by pressure conditions within the valve.

| | | | Weld unions | | | | | | | | |

Tolerance of the start and end values from the setting range is $\pm\,10\%$

Note: Dimensions for PN 25, PN 16 and PN 10 flanges are identical in the range of DN 15 - 50 Ordering example: **RD123 R 3311 25/150-25/W**

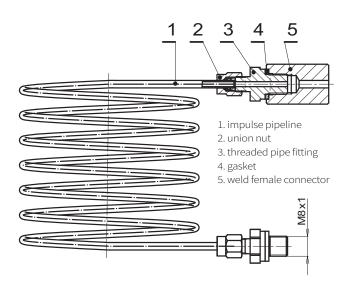

Accessories

Impulse pipeline for supply of pressure impulse

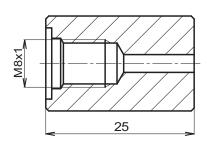

into regulator

It is in the scope of supply as standard.

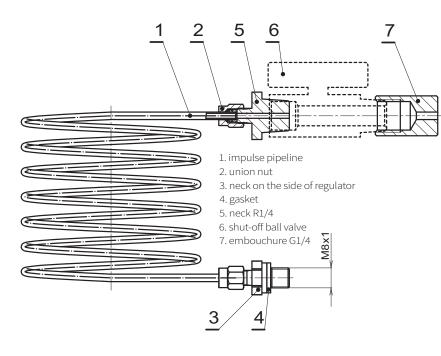

Welding coupling for connecting of impulse pipe It is in the scope of supply as standard.

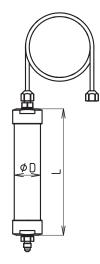

Material: 1.0036 / 11 373.0 Ordering code: VM 43 0046

Impulse pipe for supplying a pressure impulse with shut-off ball valve and connecting thread 1/4"

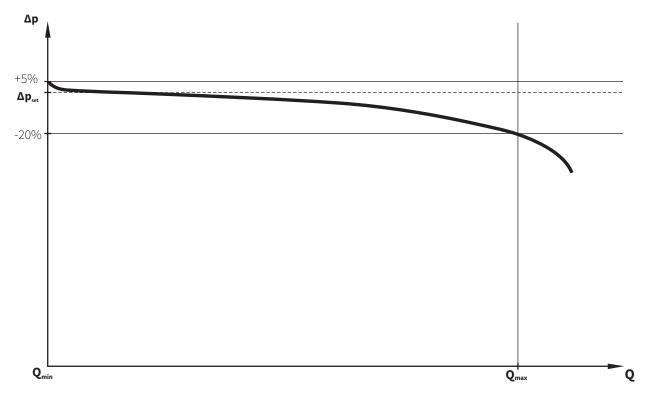

Cooling condensate well It is in the scope of supply as standard for valves in version up to 180°C

| Dimensions of cooling cond. well | | | | | | | |
|----------------------------------|------|------|--|--|--|--|--|
| Diaphragm | L | ØD | | | | | |
| | [mm] | [mm] | | | | | |
| 26 cm² | 135 | 28 | | | | | |
| 63 cm² | 100 | 20 | | | | | |

Δp flow rate diagram for RD 122 D, P, V

| 40 | 21 | 6.30 | 10.80 | 11.90 | 13.30 | 16.00 | 20.00 | 26.40 | 33.00 | 1.05 |
| 50 | 32 | 7.00 | 12.10 | 14.40 | 17.50 | 21.00 | 26.50 | 34.00 | 42.00 | 1.25 |

For in-between values of Δp_{set} , it is possible to calculate an approximate value of Q_{max} according to the following formula:

$$\mathbf{Q}_{max} = \frac{\mathbf{Kvs}}{\mathbf{k}} \cdot \sqrt{\frac{\Delta \mathbf{p}_{set}}{\mathbf{100}}}$$
,

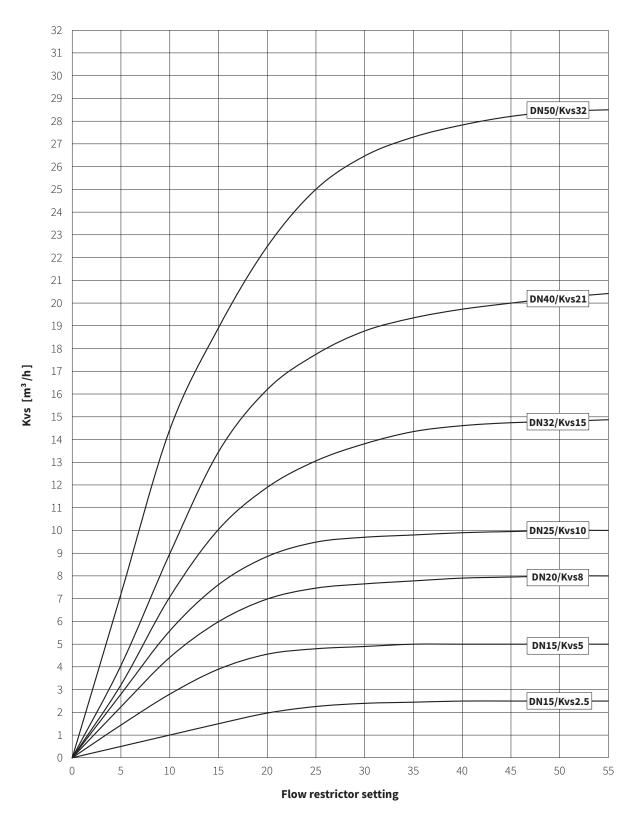

where: **Δp**_{set} **k** [kPa]

For minimum flow rate $Q_{\rm min}$ the following applies $Q_{\rm min}$ = 0.
